SUBCELLULAR LOCATION: Present predominantly in the cytoplasm, is also found in small quantities in the nucleus.
SIMILARITY: Belongs to the DNA2/NAM7 helicase family.
                                                                 19;

Peltz S, Czaplinski K, Dinman ð

(UYNE-) UNIV NEW JERSEY.

WPI; 2000-171458/15.

New multiprotein complex which can modulate peptidyl transferase activity during translation, useful to treat diseases associated with peptidyl transferase activity e.g. Duchene/Becker Muscular Dystrophy.

Claim 41; Page 80; 89pp; English.

The invention provides a new multiprotein complex which can modulate peptidyl transferase activity during translation. The complex comprises the gene encoding Helicase B (HCSB; renamed MTT1, for Modulator of Translation Termination) and the conserved proteins known to interact and carry out translation termination in eukaryotic cella, peptidyl eukaryotic release factor (eRF) 1 and eRF3. The complex can be used to modulate peptidyl transferase activity during translation in a cell. It can be administered therapeutically combined with a carrier in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           termination. Vectors comprising polynucleotides encoding the complex (or antisense sequences) can be constructed and introduced into cells to interfere with complex expression and so modulate the efficiency of translation termination of mRNA and/or degradation of aberrant transcripts in a cell. Agents binding to the complex can be identified and included in therapeutic compositions useful as above, and/or used to modulate peptidyl transferase activity during translation in cells. They are also useful to modulate the efficiency of translation termination of mRNA at a nonsense codon and/or promote degradation of aberrant transcripts in cells. The method can be used to identify agents/compositions modulating binding to MTT1, useful to identify genes. Sequences AAY77804-812 represent motifs I-IX comprised in the genes of the property and the property modulation of the second control of the second control of the second can be used to identify genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transferase activity, especially diseases resulting from a nonsense or frameshift mutation e.g. beta-thalassemia, beta-globin, Ducheme/Becker Muscular Dystrophy etc. It can be used to identify disease conditions involving a defect in the complex, by transfecting cells with encoding nucleic acid and determining the proportion of defective complex before and after transfection. It is also useful to screen for drugs involved i peptidyl transferase activity during translation, inhibiting the interaction between MTI and eRF3 or involved in enhancing translation
Identifying an agent that increases nonsense suppression, for antivira therapy, by contacting modulator of translation termination (Mttl) in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of identifying an agent that increases nonsense suppression, by contacting modulator of translation termination (MTT1) also referred to as helicase B (HCSB) in Saccharomyces cerevisiae. The method is useful for identifying compositions or agents which increase nonsense suppression. The invention may also be used for antiviral therapy and for suppression of pathological nonsense mutations. The present sequence is Saccharomyces cerevisiae motif peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Saccharomyces cerevisiae with a test agent, and detecting specific binding to Mttl.
                                                                                                                                                                                                                                                 (PELT/)

0

Identifying a test composition or agent that modulates the efficiency translation termination comprises contacting the MTT1 with the test composition or agent, and determining if the test composition or agent inhibits the MTT1.

Claim 41; SEQ ID NO 9; 41pp; English

transcripts, and provide modulators (inhibitors/stimulators) of speptidyl transferase activity during initiation, elongation, termination and mRNA degradation of translation. The agents, which may be antagonists or agonists, are useful in screening, diagnostic and therapeutic purposes, for diseases or conditions resulting from or cause premature translation, such as beta-thalassaemia, beta-globin, Duchenne/Becker Muscular Dystrophy, Haemophilia B, Von Willebrand Disease, Ostrophy, Haemophilia B, Von Willebrand Disease, Ostrophy, Haemophilia B, Von Willebrand Disease, Pamilial Tumour, Hirschsprung disease, Cystic fibrosis, Kidney Stones, Familial hypercholesterolaemia, Retinitis Figmentosa, or Neurofibromatosis, Retinoblastoma, ATM or Costmann Disease. The present sequence represents the amino acid sequence of the yeast translation termination modulation protein motif IX. the RNA helicase MTT1 with a composition or agent under conditions permitting binding between the MTT1 and the composition, detecting specific binding of the test composition or agent to the MTT1. Indetermining if the test composition or agent inhibits the MTT1. The composition and methods are useful for modulating the fidelity of translation termination or for identifying agents that: affect the functional activity of mRNAs by altering frameshift frequency, permit monitoring of a termination event, promote degradation of aberrant The invention modulates the relates to a method of identifying a test composition that efficiency of translation termination comprising contacting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of identifying an agent that increases nonsense suppression, by contacting modulator of translation termination (MTT1) also referred to as helicase B (HCSB) in Saccharomyces cerevisiae. The method is useful for identifying compositions or agents which increase nonsense suppression. The invention may also be used for antiviral therapy and for suppression of pathological nonsense mutations. The present sequence is Saccharomyces cerevisiae MTT1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying an agent that increases nonsense suppression, for antiviral therapy, by contacting modulator of translation termination (Mttl) in Saccharomyces cerevisiae with a test agent, and detecting specific
                                                                       composition or agent, inhibits the MTT1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
```

The invention relates to a method of identifying a test composition that modulates the efficiency of translation termination comprising contacting

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc permitting binding between the MTT1 and the composition, detecting effecting binding of the test composition or agent inhibits the MTT1. The composition and methods are useful for modulating the fidelity of translation termination or for identifying agents that: affect the CC composition and methods are useful for modulating the fidelity of translation termination or for identifying agents that: affect the CC functional activity of mRNAs by altering frameshift frequency, permit CC monitoring of a termination event, promote degradation of abservant CC transcripts, and provide modulators (inhibitors/stimulators) of peptidyl transferase activity during initiation, elongation, termination and mRNA CC degradation of translation. The agents, which may be antagonists or CC agonists, are useful in screening, diagnostic and therapeutic purposes, CC for diseases or conditions resulting from or cause premature translation, csuch as beta-thalassaemia, beta-globin, Duchemne/Becker Muscular Dystrophy, Haemophilia A, Haemophilia B, Von Willebrand Disease, CC officespenesis Imperfecta, Breast cancer, Ovarian Cancer, Wilms Tumour, CC Hirschsprung disease, Cystic fibrosis, Kidney Stones, Familial CC Retinoblastoma, ATM or Costmann Disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC emigrobial source. The invention also relates to a transformed plant of transformed plant baving an improved property. The plant is a crop plant comprising the recombinant DNA construct and a method of producing a cc transformed plant having an improved property. The plant is a crop plant cc such as maize or soybean. The method of producing a transformed plant cc recombinant DNA construct and growing the transformed plant, where the cc polynuclectide or polypeptide is useful for improving plant with the climatory of the recombinant DNA construct is useful for improving plant properties. Cc The recombinant DNA construct is useful for producing plant with cc improved plant properties, e.g. improved cold, heat or drought tolerance, cc increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of potcein yield and/or cc condition, improved lignin production or improved galactomannan cc condition, improved lignin production or improved galactomannan cc growth invention. Note: The sequence data for this patent did not cf form part of the printed specification but was obtained in electronic cc format from USPTO at sequence data for this patent did not format from USPTO at sequence aspects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The invention relates to a recombinant DNA construct comprising a CC promoter functional in a plant cell, where the promoter is positioned to CC provide for expression of a polymucleotide encoding a polypeptide from a CC microbial source. The invention also relates to a transformed plant CC comprising the recombinant DNA construct and a method of producing a CC transformed plant having an improved property. The plant is a crop plant CC such as maize or soybean. The method of producing a transformed plant CC such as maize or soybean. The method of producing a plant with the recombinant DNA construct and growing the transformed plant, where the CC polynucleotide or polypeptide is useful for improving plant properties. CC The recombinant DNA construct is useful for producing plant properties. CC improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to harbicides, extreme osmotic conditions, pathogens or pests, colerance to plant disease, better growth rate by modification CC of the cell cycle pathway with plant growth regulators, increased rate of the monologous recombination, modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved lignin production of the protosynthesis or by condition, improved plant growth and development under at least one stress condition, improved lignin production of the protosynthesis or by production. This sequence represents a bacterial polypeptide used in the grope of the invention. Note: The sequence data for this patent did not form part form lugary are secretal untro.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating syndrome associated with ORFX-associated disorder. ORFX polynucleotide

cerevisiae SEN1 protein.

```
CC carry out translation termination in eukaryotic cells, peptidyl
CC eukaryotic release factor (eRP) 1 and eRP3. The complex can be used to
CC modulate peptidyl transferase activity during translation in a cell. It
CC can be administered therapeutically combined with a carrier in
CC pharmaceutical compositions to treat diseases associated with peptidyl
CC transferase activity, especially diseases associated with peptidyl
CC transferase activity, especially diseases resulting from a nonsense or
CC Muscular Dystrophy etc. It can be used to identify disease conditions
CC involving a defect in the complex, by transfecting cells with encoding
CC and after transferase activity during translation, inhibiting the
CC peptidyl transferase activity during translation, inhibiting the
CC interaction between MTI and eRP3 or involved in enhancing translation
CC termination. Vectors comprising polymucleotides encoding the complex of
CC interfere with complex expression and so modulate the efficiency of
CC translation termination of mRNA and/or degradation of aberrant

                                                                                                                                                                  transcripts in a cell. Agents binding to the complex can be identified and included in therapeutic compositions useful as above, and/or used to modulate peptidyl transferase activity during translation in cells. They are also useful to modulate the efficiency of translation termination of mRNA at a nonsense codon and/or promote degradation of aberrant transcripts in cells. The method can be used to identify agents/compositions modulating binding to MTT1, useful to identify genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying an agent that increases nonsense suppression, for anti-
therapy, by contacting modulator of translation termination (Mtt1)
Saccharomyces cerevisiae with a test agent, and detecting specific
binding to Mtt1.
                                                                                                                                                                                                                                                                                                                                                         Saccharomyces cerevisiae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Yeast helicase Senl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 472
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of identifying an agent that increases nonsense suppression, by contacting modulator of translation termination (MTT1) also referred to as helicase B (HCSB) in Saccharomyces cerevisiae. The method is useful for identifying compositions or agents which increase nonsense suppression. The invention may also be used for antiviral therapy and for suppression of pathological nonsense mutations. The present sequence is Saccharomyces cerevisiae SEN1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2003-810549/76

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of identifying a test composition that combodiates the efficiency of translation termination comprising contacting the RNA helicase MTTI with a composition or agent under conditions comparising contacting contacting the RNA helicase MTTI with a composition or agent under conditions composition and methods are useful for modulating the MTTI. The composition and methods are useful for modulating the fidelity of composition and methods are useful for modulating that: affect the composition and methods are useful for modulating that: affect the composition and methods are useful for modulating that: affect the composition and methods are useful for modulating that: affect the composition and civity of maNAs by altering frameshift frequency, permit composition activity of maNAs by altering frameshift frequency, permit committees and provide modulators (inhibitors/stimulators) of peptidyl transcripts, and provide modulators (inhibitors/stimulators) of peptidyl cranscripts, and provide modulators (inhibitors/stimulators) of peptidyl cransfersse activity during initiation, elongation, termination and maNA comparation of translation. The agents, which may be antagonists or composition of constance useful in screening, diagnostic and therapeutic purposes, composits, are useful in screening, diagnostic and therapeutic purposes, composition, and managential permit and therapeutic purposes, constance beta-chalasseemia, beta-globin, buchemne/Becker Muscular constance of the sequence, or well-brand Disease, Cystic fibrosis, Kidney Stones, Pamilial Tumour, constance of the yeast helicase Seni.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best Loc

Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete document is available on CD-ROM

Claim 1;

SEQ ID

NO 1830; 122pp; English

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

```
RESULT 15
ADN19177
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       묽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ភន្តន្តន្តន្តន្តន្តន្តន្តន្តន្តន្តន្
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that the hybridize to the nucleic acids encoding the protein under low stringency conditions. The protein complexes are useful as targets for an active agent of a pharmaceutical. These protein complexes are particularly cuseful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or considered. The presence of a disease or disorder or a predisposition of or developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or components of the complex is useful for the manufacture of a medicament components of the complex is useful for the manufacture of a medicament corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was complexed that modulates the manufacture of a medicament corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was considered from the EPO in electronic format).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

CC The invention relates to a recombinant DNA construct comprising a CC provide for expression of a polynucleotide encoding a polypeptide from a CC microbial source. The invention also relates to a transformed plant CC microbial source. The invention also relates to a transformed plant CC transformed plant thaving an improved property. The plant is a crop plant CC such as maize or soybean. The method of producing a transformed plant CC having an improved property comprises transformed plant with the CC recombinant DNA construct and growing the transformed plant with the CC improved plant but construct is useful for improving plant properties. CC The recombinant DNA construct is useful for improving plant properties. CC improved plant properties, e.g. improved cold, heat or drought tolerance, colding plant properties, e.g. improved cold, heat or drought tolerance, coldinare to herbicides, excreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or consophorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan cc condition. Note: The sequence data for this patent did not cf form part of the printed specification but was obtained in electronic cc format from USPTO at segdata.uspto.gov/sequence.html.
